# CDIS vs Superview

**Data compared: 16 Oct 2026 Shift 2 to 28 Oct 2026 Shift 3** (17 day-shifts) · SSC CGL 2026 · Source: CDIS vs Superview comparison report (Superview event and camera exports; CDIS database of 31 Oct 2026; common cameras only)

Across every exam shift compared, CDIS kept more cameras online for the whole exam, delivered **8 times as many client-confirmed incidents**, and its alerts were accepted about **14 times as often** as Superview's.

**92.4%** vs 45.7%
Cameras online for the whole shift, average

**2,322** vs 288
True-positive alerts: accepted by the client

**8.3%** vs 0.6%
Acceptance rate at the client

**12** vs 169
Alerts the client reviews for each confirmed incident

## 1 Camera status: more cameras online for the whole exam

**92.4% of CDIS cameras were online for the whole shift. For Superview it was 45.7%.**

- **Superview's 95.5% "online" includes cameras that dropped out.** Superview counts a camera as online even if it went offline during the shift. Of its cameras, **45.7%** stayed online for the whole shift and **49.7%** were only partly online: they went offline at some point. Together that makes its 95.5%.
- **Only half of Superview's cameras watched the whole exam.** Nearly one in two Superview cameras had a gap in coverage. CDIS kept **92.4%** of the same cameras online for the whole shift.
- **Twice as many cameras watching the whole exam.** On average CDIS had **3,719** cameras online for the whole shift; Superview had **1,832**. That is **2.0 times as many**.
- **Same cameras compared.** Both systems are compared on the same **4,015** cameras in 113 centres per shift on average: the cameras Superview scheduled for each session, all of which are also in the CDIS camera list.
- **Steady every shift.** CDIS was between **87.3% and 95.6%** online for the whole shift in every shift it ran. Superview was between 28.8% and 56.5%.

| Average per shift | Cameras | Online whole shift | Partly online | Total online | Offline |
|---|---|---|---|---|---|
| **CDIS** | 4,015 | **3,719 (92.4%)** | – | 3,719 (92.4%) | 304 (7.6%) |
| Superview | 4,015 | 1,832 (45.7%) | 2,002 (49.7%) | 3,834 (95.5%) | 181 (4.5%) |

Partly online = the camera went offline for part of the shift. Total online = online whole shift + partly online.

> **Planned enhancement (from the next examination):** CDIS will monitor camera availability continuously throughout each shift and will also report partially online cameras, that is, cameras that go offline for part of the shift. Each camera will be classified as online for the whole shift, partially online, or offline, giving the client a complete record of camera coverage for the entire examination.

## 2.1 Necessary, true-positive events: incidents only CDIS found

**The client confirmed 2,322 CDIS alerts against 288 Superview events: 8.1 times as many true positives.**

- **Incidents Superview missed. 2,191** of CDIS's accepted alerts (**94.4%**) were incidents Superview did not report at all. Only 253 accepted Superview events had no CDIS alert.
- **Net gain.** For every confirmed incident only Superview caught, CDIS caught **8.7** that Superview missed.
- **Fewer, more useful alerts.** CDIS sent 28,096 alerts against Superview's 48,657 (**42% fewer**), yet delivered 8.1 times the confirmed incidents.

Superview figures are from its own camera report for each session: online whole shift, partly online (offline for part of the shift) and offline for the whole shift. CDIS online = cameras CDIS reached and checked in the shift. Only common cameras are counted: cameras Superview scheduled for the session that are also in the CDIS camera list; CDIS alerts on other cameras are left out. Averages are per shift over the 17 shifts (CDIS online: the 16 shifts it ran).

## 2.2 True-positive events by analytic

Client-accepted alerts (true positives), 16–28 Oct. CDIS confirmed more incidents in 9 of the 10 analytics both systems run.

| Analytic | CDIS accepted | Superview accepted | CDIS vs Superview |
|---|---|---|---|
| Invigilator Static | **1,640** | 181 | **9.1×** |
| Entry/Exit Movement | **228** | 8 | **29×** |
| Less than 5 people in a lab | **144** | 16 | **9.0×** |
| Crowd (Entry/Exit) | **114** | 1 | **114×** |
| Phone (Server Room) | **84** | 53 | **1.6×** |
| Zero Person | **47** | 9 | **5.2×** |
| Server Room Threshold | **44** | 13 | **3.4×** |
| Phone (Inside Lab) | **11** | 0 | **only CDIS** |
| Close Proximity | **9** | 2 | **4.5×** |
| **All analytics** | **2,322** | **288** | **8.1×** |

## 3 Accuracy: a higher acceptance rate at the client

**8.3% of CDIS alerts were accepted by the client, against 0.6% of Superview's: about 14 times more accurate.**

- **Every shift.** CDIS had the higher acceptance rate in **16 of 16** day-shifts it ran: **4.3%–13.4%**, against 0.1%–1.1% for Superview.
- **Every analytic.** Higher acceptance rate in **10 of 10** analytics both systems run, e.g. Invigilator Static **55.5%** vs 21.0%, Phone (Server Room) **20.4%** vs 1.2%, Phone (Inside Lab) **13.8%** vs 0.0%, Server Room Threshold **11.7%** vs 1.5%.
- **Less review work.** The client reviewed **12** CDIS alerts per confirmed incident, against **169** Superview events, **14 times less effort** per finding.
- **Improving.** CDIS reached its best rates on the last exam day: **13.4%** (28 Oct Shift 2) and **10.9%** for the day.

| Acceptance rate | CDIS | Superview |
|---|---|---|
| Shift 1 | **6.8%** | **0.7%** |
| Shift 2 | **10.9%** | **0.6%** |
| Shift 3 | **7.1%** | **0.5%** |
| **All shifts** | **8.3%** | **0.6%** |

| By exam day | CDIS | Superview |
|---|---|---|
| 16 Oct | **8.2%** | 0.5% |
| 22 Oct | **5.4%** | 0.6% |
| 23 Oct | **4.8%** | 0.8% |
| 24 Oct | **10.0%** | 0.2% |
| 27 Oct | **7.5%** | 0.6% |
| 28 Oct | **10.9%** | 0.9% |

**In short:** On the same cameras, CDIS keeps more of them fully online, finds incidents Superview misses (2,191 confirmed incidents Superview did not report), and gives the client alerts that are about 14 times more likely to be real, with 42% fewer alerts to review.

Scope: data compared from 16 Oct Shift 2 to 28 Oct Shift 3, 17 day-shifts (16 Oct Shifts 2–3; 22, 23, 24, 27 and 28 Oct, all shifts). 16 Oct Shift 1 excluded; CDIS did not run on 23 Oct Shift 3. Accepted = accepted by the client (Superview: Verified). Acceptance rate = accepted ÷ all alerts sent; items still pending review count as not accepted for both systems, so both rates are lower bounds. Same incident = same camera and analytic within ±3 minutes. Only cameras common to both systems are counted (cameras Superview scheduled for the session, all of which are in the CDIS camera list); 314 CDIS alerts on other cameras are left out. Sources: Superview Events Reports and session camera reports (exported 29–30 Oct 2026); CDIS database of 31 Oct 2026.
