CDIS Performance Advantage over Superview

SSC CGL 2026 (exam 42) · exam days 16 (Shifts 2–3), 22, 23, 24, 27 and 28 Oct 2026 · all shifts · Source: CDIS vs Superview comparison report (Superview exports of 29–30 Oct 2026, CDIS database of 30 Oct 2026)

7.4% vs 0.6%	**2,094 vs 288**	**13.6 vs 169**	**16 of 16**
client acceptance rate (CDIS vs Superview)	accepted detections (CDIS raised 42% fewer alerts)	alerts reviewed per accepted alert (CDIS vs Superview)	day-shifts in which CDIS has the higher acceptance rate

Fourteen Data-Supported Findings

1 Client acceptance rate is twelve times higher

The client accepted **7.4%** of CDIS detections (2,094 of 28,410), compared with **0.6%** of Superview events (288 of 48,657). CDIS detections were accepted 12 times as often.

2 Higher accepted volume from a smaller alert load

CDIS produced **2,094** accepted detections against **288** for Superview (7.3 times as many), while generating 42% fewer alerts (28,410 versus 48,657).

3 Substantially lower review effort per accepted alert

A reviewer must examine approximately **169 Superview events** to reach one accepted event, compared with approximately **13.6 CDIS detections**. This represents a 12-fold reduction in review effort.

4 Consistent advantage across all operating shifts

CDIS recorded the higher accepted rate in **16 of 16** day-shifts for which CDIS data exists (17 day-shifts in total across six exam days; 16 Oct Shift 1 is excluded and CDIS did not run on 23 Oct Shift 3). Across day-shifts, CDIS ranged from 4.2% to 12.8% and Superview from 0.1% to 1.1%.

5 Consistent advantage on every exam day

Accepted rates by day: 16 Oct, CDIS 8.3% versus 0.5%; 22 Oct, CDIS 5.5% versus 0.6%; 23 Oct, CDIS 4.9% versus 0.8%; 24 Oct, CDIS 10.0% versus 0.2%; 27 Oct, CDIS 7.6% versus 0.6%; 28 Oct, CDIS 7.1% versus 0.9%. CDIS peaked on 24 Oct at 10.0%.

6 Consistent advantage in each of the three shifts

Shift 1: CDIS 6.3% versus 0.7%. Shift 2: 9.5% versus 0.6%. Shift 3: 6.3% versus 0.5%. The result is not attributable to any single time slot.

7 Higher acceptance in all 10 analytics operated by both systems

CDIS achieved the higher accepted rate in every script raised by both systems. The widest margins were: Phone (Server Room), 18.2% versus 1.2%; Phone (Inside Lab), 13.8% versus 0.0%; Server Room Threshold, 11.4% versus 1.5%; and Close Proximity, 7.0% versus 0.1%.

8 Phone detection in server rooms: more accepted alerts at a ninth of the volume

For Phone (Server Room), CDIS generated **86 accepted** detections from 472 alerts, whereas Superview generated 53 accepted events from 4,308. CDIS therefore delivered the higher accepted count with 9 times fewer alerts.

9 Phone detection inside labs: no Superview alert was accepted

Superview raised **5,615** Phone (Inside Lab) events, of which **none** were accepted. CDIS raised 80 detections, of which the client accepted **11** (13.8%).

10 Markedly higher precision in the high-volume analytics

Crowd (Entry/Exit): Superview 9,858 events with 1 accepted (0.01%); CDIS 2,970 detections with 108 accepted (3.6%). Entry/Exit Movement: Superview 6,075 events with 8 accepted; CDIS 9,980 with 231 accepted. Monitor Tampering (Superview only): 4,352 events with 1 accepted.

11 Additional client-accepted detections not raised by Superview

1,980 detections accepted by the client (94.6% of all accepted CDIS detections) had no Superview event for the same camera and analytic within ±3 minutes.

12 Higher client acceptance on jointly detected events

3,277 Superview events were matched by a CDIS detection (same camera, same analytic, within ±3 minutes), and 2,850 CDIS detections were matched by a Superview event. The client accepted **114** of the matched CDIS detections (4.0%) but only **35** of the matched Superview events (1.1%), an acceptance rate 3.7 times as high.

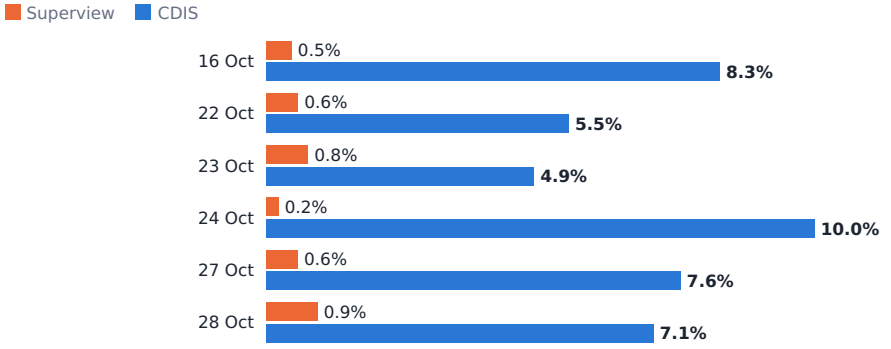
13 Broader assigned camera scope per shift

The CDIS camera set averages **4,391 cameras** per shift across 119 centres, against 4,015 cameras across 113 centres for Superview, which excludes an average of 1,510 cameras per session; the CDIS set is larger in 17 of 17 shifts. The number of cameras actually online is comparable (average 3,834 for Superview and 3,766 for CDIS, over shifts with a CDIS classification run).

14 Smaller volume of unreviewed alerts

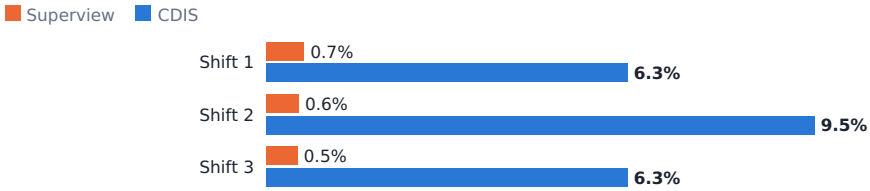
21,851 Superview events remain pending, against 12,066 CDIS detections (45% fewer), which reduces the outstanding review workload for the client. The pending share is similar for both systems (44.9% for Superview, 42.5% for CDIS); the reduction follows from the lower CDIS alert volume.

Acceptance Rate by Exam Day

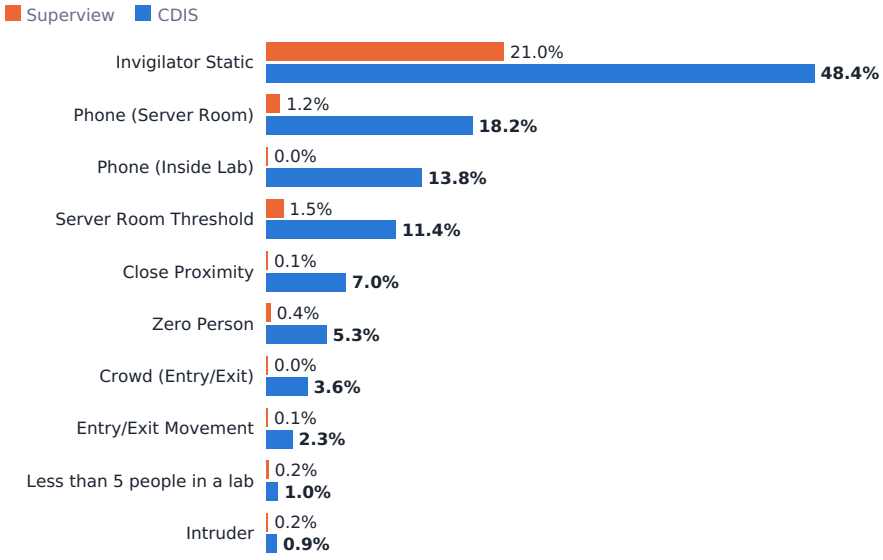


Day	Superview events	Accepted	Rate	CDIS detections	Accepted	Rate
16 Oct	5,627	26	0.5%	3,097	256	**8.3%**
22 Oct	8,744	51	0.6%	2,846	157	**5.5%**
23 Oct	8,884	68	0.8%	3,442	168	**4.9%**
24 Oct	9,029	20	0.2%	4,534	453	**10.0%**
27 Oct	8,333	48	0.6%	7,507	567	**7.6%**
28 Oct	8,040	75	0.9%	6,984	493	**7.1%**
Total	**48,657**	**288**	**0.6%**	**28,410**	**2,094**	**7.4%**

Acceptance Rate by Shift



Acceptance Rate by Analytic (analytics operated by both systems)



Analytic	Superview events	Accepted	Rate	CDIS detections	Accepted	Rate
Invigilator Static	862	181	21.0%	2,993	1,449	**48.4%**
Phone (Server Room)	4,308	53	1.2%	472	86	**18.2%**
Phone (Inside Lab)	5,615	0	0.0%	80	11	**13.8%**
Server Room Threshold	862	13	1.5%	385	44	**11.4%**
Close Proximity	3,137	2	0.1%	128	9	**7.0%**
Zero Person	2,433	9	0.4%	861	46	**5.3%**
Crowd (Entry/Exit)	9,858	1	0.0%	2,970	108	**3.6%**
Entry/Exit Movement	6,075	8	0.1%	9,980	231	**2.3%**
Less than 5 people in a lab	8,681	16	0.2%	10,431	109	**1.0%**
Intruder	2,474	4	0.2%	109	1	**0.9%**

Notes on Methodology and Interpretation

- **Definitions.** "Accepted" denotes acceptance by the client. "Not accepted" comprises rejected and pending items for both systems. Pending items have not yet been reviewed; both acceptance rates are therefore lower bounds.
- **Scope.** The analysis covers 17 day-shifts. 16 Oct Shift 1 is excluded, and CDIS did not run on 23 Oct Shift 3; that shift contains Superview events only.
- **Camera availability.** The two systems measure availability differently. Superview counts a camera as online if it was online for at least one minute of the shift (average 95.5% of its scheduled cameras). CDIS counts a camera as online if it was classified in the shift's latest classification run (average 85.6% of a larger camera set). These figures are indicative and are not directly comparable.
- **Invigilator Static.** Its figures (2,993 CDIS detections, 48.4% accepted; 862 Superview events, 21.0% accepted) are included in the all-analytics comparison but are not cited as an advantage, because CDIS records a broader set of invigilator alerts under this name.
